

AH69X series

High Voltage Hall Effect Switch Sensor

Alfa Electronics Co.,Ltd

Introduction

The AH693, AH694, AH695 and AH696 are high performance linear Hall-Effect sensors and are operated by the magnetic field from a permanent magnet or an electromagnet. The ratiometric output voltage is set by the supply voltage and varies in proportion to the strength of the magnetic. The quiescent output voltage of the AH693, AH694, AH695, AH696 is 50% of the supply voltage, and the sensitivity is 3mV/Gauss, 3.75mV/ Gauss, 6mV/ Gauss and 12mV/ Gauss respectively.

Each sensor has a monolithic circuit which integrates a Hall element, improved temperature compensating circuitry to reduce the intrinsic sensitivity drift of the Hall element, a small-signal high-gain amplifier, and a rail-to-rail low-impedance output stage.

The features of these devices make them ideal for use in automotive and industrial applications requiring high accuracy, and are guaranteed though an extended temperature range, -40°C to 125°C.

These devices are available in a 3-pin T092S package and SOT89. Both packages are lead(Pb) free, with 100% matte tin leadframe plating.

The AH69X family provides a variety of packages to customers: flat T092S for through-hole mount and SOT89 for surface mount. All packages are RoHS compliant.

Features

- Low-noise output with enhanced accuracy
- Ratiometric rail-to-rail output
- 4.5 to 10.5V supply voltage range
- High operation frequency
- Output voltage proportional to magnetic flux density
- Highest ESD performance up to ± 4 kV
- -40°C to 125°C wide temperature range
- Fast power-on time
- Precise recoverability after temp. cycling
- 3-pin SIP and SOT89 package are available
RoHS Compliant
- 2011/65/EU

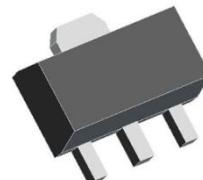

Applications

- Angular position
- Displacement sensing
- Over current detection
- BLDC motor current monitoring
- Weight and liquid level sensing

Family Members

Part number	Package	Packing	Sensitivity
AH693	T092S/SOT89	Bag: 1k; Tape&reel: 3K	3.0 mV/Gauss
AH694	T092S/SOT89	Bag: 1k; Tape&reel: 3K	3.75 mV/Gauss
AH695	T092S/SOT89	Bag: 1k; Tape&reel: 3K	6.0 mV/Gauss
AH696	T092S/SOT89	Bag: 1k; Tape&reel: 3K	12 mV/Gauss

Absolute Maximum Ratings

The absolute maximum value is the limiting value when the chip is applied, above which the chip can be damaged. Although the function of the chip is not necessarily damaged when the absolute maximum value is exceeded, the reliability of the chip may be affected if the absolute maximum value is exceeded for a certain time.

Parameters	Symbol	Value	Units
Supply voltage	VCC	11	V

Vout	2	3	Output from sensor
GND	3	2	Ground

CHARACTERISTIC DEFINITIONS

Quiescent Voltage Output In the quiescent state (that is, with no significant magnetic field: $B = 0$), the output, $V_{OUT}(Q)$, equals a ratio of the supply voltage, V_{CC} , throughout the entire operating range of V_{CC} and the ambient temperature, TA .

Quiescent Voltage Output Drift Through Temperature Due to internal component tolerances and thermal considerations, the quiescent voltage output, V_{OUTQ} may drift from its nominal value through the operating ambient temperature range TA . For purposes of specification, the Quiescent Voltage Output Drift Through Temperature Range, V_{outQ} drift (T) is defined as:

$$V_{outQ} \text{ drift } (T) = (V_{OUTQ}(T) - V_{OUTQ}(25^\circ\text{C})) / V_{OUTQ}(25^\circ\text{C}) \times 1/(T - 25^\circ\text{C}) \times 100\% \quad (1)$$

Sensitivity The presence of a south-polarity magnetic field perpendicular to the branded surface of the package increases the output voltage from its quiescent value toward the supply voltage rail. The amount of the output voltage increase is proportional to the magnitude of the magnetic field applied. Conversely, the application of a north polarity field will decrease the output from its quiescent value. This proportionality is specified as the magnetic sensitivity, $Sens$ (mV/G), of the device and is defined as:

$$Sens = (V_{OUT}(B+) - V_{OUT}(B-)) / (B(+) - B(-)) \quad (2)$$

where $B(+)$ and $B(-)$ are two magnetic fields with opposite polarities.

Sensitivity Drift Through Temperature The device sensitivity changes with temperature, with respect to its sensitivity temperature coefficient. Sensitivity Drift (T) may drift from its nominal value through the operating ambient temperature range TA . For purposes of specification, the Sensitivity Drift Through Temperature, Sensitivity Drift (T) is defined as:

$$\text{Sensitivity Drift } (T) = (\text{Sensitivity } (T) - \text{Sensitivity } (25^\circ\text{C}) / \text{Sensitivity } (25^\circ\text{C}) \times 1/(T - 25^\circ\text{C}) \times 100\% \quad (3)$$
